1. Introduction

Lee County's Hydrological Data Network began in 1989 as part of the County's initial efforts at establishing a comprehensive Surface Water Management Plan. It had become obvious that demands on our water resources were making past drainage policies obsolete. Allowing storm water to flow quickly and unabated into the Gulf of Mexico was acceptable when the population was sparse and water shortages unknown. However, as the population exploded in the 80's, the County recognized the need to manage our water resources more carefully. Because each of the County's 48 watersheds is unique, the goal of the plan was to analyze and provide management practices for each one of them. The original purpose of the Hydrological Data Network was to provide the data necessary to achieve that goal.

The study was initially conducted in the area of the Six Mile Cypress watershed in 1990 and continued with the analysis of 10 additional watersheds in 1991, 19 watersheds in 1992, and 6 more in 1997. In 2005, three additional watersheds were analyzed and the re-analysis of portions of the Gator Slough watershed was performed. Lee County Natural Resources completed a re-analysis of 15 watersheds in North Fort Myers in 2010. As each study is conducted, the Network has expanded to include the gauges necessary to evaluate each watershed.

Over time, the monitoring network has also grown to meet multiple objectives and demands. Currently the data provides information necessary to effectively operate the numerous flood control and environmental structures throughout the County. Furthermore, the information is being used to establish and calibrate various hydrological, hydraulic, and storm water runoff models. The program also provides County departments, numerous government agencies and private entities as well as the public with information needed for planning, permitting and construction/development. Accordingly, the network is continuously upgraded and expanded to provide more comprehensive and up to date information.

The Network currently consists of 186 shallow monitoring wells, 23 recording rain gauges, and 12 continuous stage recorders. The County has a joint agreement with the United States Geological Survey (USGS) for the operation of 8 additional continuous stage recorders.

1.1. As reported in 2009 Annual Hydrology Report, Lee County hired a consultant to prepare a quality assurance and quality control (QA/QC) report for the

Stage and Groundwater data. The goal of this project was to provide the baseline of quality assurance and quality control of rainfall, stage, and groundwater time series data that are used in support of the County's reporting and comprehensive planning process. QA/QC includes analysis of the data through performance of statistical analyses, application of statistical modeling tools, and filling missing data. The report can be viewed at the Hydrological Monitoring web site.

1.2. Instrumentation:

- **Tipping Bucket** works by funneling collected rain to land on the pivot-point of a two-sided "bucket." When one side fills, it pivots down--causing the "bucket-tip" to be recorded, emptying the bucket and bringing the empty side under the collection point. Each bucket-tip occurs when 0.01 inches of rain has been collected. The tipping bucket assembly tips and activates a reed switch. The switch closure is recorded by the data logger pulse channel.
- **Pressure Transducer** -The KPSI 500 and CS451 submersible hydrostatic level transducer represents the leading edge of level sensing technology available today. Incorporating a highly stable media-isolated sensor and features SDI-12 serial-digital interface. SDI-12 is a standard for interfacing data recorders with microprocessor-based sensors, especially in the environmental monitoring field.
- **Data Loggers** Campbell Scientific measures electrical signals and converts the measurement to engineering units, performs calculations and reduces data to statistical values. Not every measurement needs to be stored. The data logger will store data in memory awaiting transfer to the PC via external storage devices or telecommunications.
- **Communications.** The Airlink Raven is a rugged, intelligent wireless data platform designed to enable real-time, two-way communications with remote assets.

1.3. Data Collection:

- The 1 ¼” monitoring wells are manually read once a month during the dry season (October-May) and twice a month during the wet season (June-September). The data is entered into an Excel worksheet on the County’s server.
- The 4” monitoring wells that are on telemetry record the water level hourly and are downloaded monthly. QA and QC is performed and then entered into an Excel worksheet on the County’s server.
- The stage recorders that do not have telemetry are downloaded once a month to a laptop, QA and QC is performed and then put into an Excel worksheet on the County’s server.
- The rain gauges, and stage recorders that have telemetry are automated to collect data 5 minutes after midnight and are stored on the County’s server for QA and QC.

Generally, the data collected at a rain gauge are only representative of rainfall at the rain gauge location. The current 23 rain gauges cover only the immediate vicinity of each gauging station – leaving a wider area of the County uncovered. The rainfall data collected is transmitted every 15 minutes to OneRain Corp. to generate a picture of Lee County with the 2-kilometer resolution grid. To supplement spatial data limitations, Lee County implemented Next Generation Weather Radar (NEXRAD).

1.4. NEXRAD uses a combination of rainfall at the rain gauges and cloud cover over an area to estimate spatial distribution of rainfall. The data that is transmitted is not verified manually for quality control purposes.

The data contains gauge-adjusted radar rainfall estimates for each 15-minute period at each pixel on a 2-kilometer resolution grid. The data set is created by merging rain gauge data with uncalibrated radar rainfall estimates. Raw radar rainfall estimates are thoroughly quality controlled and filtered to remove any discontinuities and anomalies before being calibrated with the gauge data. The gauge data is carefully quality controlled before the adjustment algorithm. Questionable data is not used in the adjustment algorithm. The end result is an archive-quality dataset of gauge-adjusted radar rainfall estimates.

1.5. Wet Season High Water Table Map (WSHWT) is calculated for the 2 inch wells as follows:

Step 1. Calculate the moving average of the three consecutive groundwater elevations at each well during the current wet season.

Step 2. Calculate the average of two highest moving average values determined in the Step 1.

Step 3. Calculate time average of WSHWT for entire period of record at each well.

Step 4. Use the time averaged WSHWTs from the Step 3 to develop the contour map

1.6. Elevation Datum:

The stage and monitoring well elevations in this report are in North American Vertical Datum (NAVD) of 1988. The average difference between the North Geodetic Vertical 29 and North American Vertical 88 in Lee County is -1.18”.

All the data in this report has been reviewed and edited in an attempt to provide the most accurate information possible. Any errors or comments should be addressed to Lee County Division of Natural Resources, 190 Evergreen, North Fort Myers, FL 33903, ATT: Scott Summerall (239)-652-6134 or via e-mail to summersa@leegov.com.

2. Monitor Wells Location Map

The water levels are read once a month during dry season (November-May) and twice a month during wet season (June-October).

4. Stage Recorders

4.1. List of Stage Recorders and Locations

The Stage records measure water levels every 15 minutes to a data logger. The ones with telemetry are download once a day.(Ten Mile, Hendry Creek, Powell Creek, Stroud Creek, Three Oaks, Deep lagoon and Telegraph).Island Park, Imperial River, Mullock Creek, Bayshore Creek, Popash Creek at Pritchard and Naile Grade are download once a month. Then the data is QA/QC and uploaded to excel with the daily, monthly average, high and low.
